

Hi Everyone,

Thank you for joining me in the IAOM NEXT Foot and Ankle Course last week. I want to share with you one of my favorite monthly cases from RadSource. I won't give it away but read the case and make your diagnosis.... It's something we talked about in the PathoAnatomy differential diagnosis section.

If you want to be on the list to receive monthly imaging cases, click the button in the upper right of the web page, and sign up.

Enjoy.

Valerie Phelps

Dear Colleague,

In this month's Radsource MRI Web Clinic, Dr. Leland Tsao provides a comprehensive review of a characteristic cause of hindfoot pain.

MRI Web Clinic: November 2020

Case 1: A 28 year old female presents to an orthopaedic surgeon with lateral left ankle pain, tenderness to palpation, and a sensation of instability. She reports left ankle injury 3 weeks ago.

MRI of the ankle was performed. Sagittal T1-weighted and fat suppressed proton density-weighted images (Images 1A and 1B), coronal T1-weighted and fat suppressed T2-weighted images (Images 1C and 1D), axial fat suppressed T2-weighted (Image 1E), and a more medial sagittal fat suppressed T2-weighted image (Image 1F) are provided.
